5G enterprise base station point-to-point data internal transmission

Overview

What is a 5G network architecture?

The following describes the concepts needed to understand 5G network architectures: Evolved Packet Core (EPC): an LTE core network. EPC is classified into two types: traditional LTE core network (supporting access through LTE base stations) and upgraded LTE core network (also called EPC+, supporting access through 5G base stations).

What is a standalone 5G network?

Standalone (SA): standalone networking. SA uses an end-to-end 5G network architecture, where 5G standards are used on terminals, base stations, and core networks. SA supports a variety of 5G new services, including eMBB, URLLC, and mMTC, and is applicable to the middle and later stages of 5G network construction.

Are 5G base stations 3GPP compatible?

In conjunction with 5G NR, private base stations (BS) can support connectivity for different spectrum bands (sub-GHz, 1 to 6 GHz, or mmWave). The 5G base station products must pass all of the test requirements prior to their release. Otherwise, the products are not 3GPP-compatible or appropriate to implement in a network.

What is the importance of active antenna systems in 5G networks?

The importance of active antenna systems in 5G networks has significantly changed the installation and maintenance of base stations. Gone are the days of simply measuring transmitter power with an absorption power meter or by using a direct connection via a “sniffer” port in the antenna feed.

Can a 5G base station be installed at ground level?

Many 5G base stations are being deployed at existing LTE sites. Each tower has a loading factor that defines the maximum weight of the radios and

antennas that can be mounted. Due to legacy hardware on the tower, the radio may be required to be installed at ground level and only the antenna is tower mounted.

What is a 5G modem?

5G modem: is built into a router to implement the 5G function and maintain compatibility with the LTE and 3G functions. User equipment (UE): a terminal device used by a user to access a wireless network. On a WAN, a UE is a router. A UE has two roles: terminal equipment (TE) and mobile station (MS).

5G enterprise base station point-to-point data internal transmission

Chapter 3: Basic Architecture -- 5G Mobile ...

Nov 5, 2019 · Fifth, the base station coordinates UE handovers between neighboring base stations, using direct station-to-station links. Exactly like the ...
