# BMS current limiting charging of lithium battery in communication base station

0 0 0 1 1 1

#### **Overview**

What is a lithium battery management system (BMS)?

Many people are familiar with a Battery Management System (BMS), which should be installed with every lithium battery. A BMS monitors the voltages of the individual lithium cells inside a battery and has the ability to shut everything down in an emergency. A BBMS, on the other hand regulates the charging of the lithium batteries.

Can a BBMS overcharge a lithium battery?

Lithium batteries are extremely sensitive to low-current overcharging. A BMS does not prevent this, but the BBMS can. It is not only possible but likely that you could overcharge your batteries when using any of the lithium-enabled solar charge controllers out there.

Does a BMS allow a battery to charge/discharge when out of range?

The BMS won't allow charge/discharge when going out of range (temperature too high/low, too much current, etc.). Most Lithium batteries have an integrated BMS these days, so it's "transparent" for the user. Total Life Cycles: Capacity reduces as batteries are cycled.

How does a BMS work in a large battery pack?

In a small battery (think "laptop battery") a BMS will also protect the cells by shutting down the current if the cells start getting too close to the edge of their safe operation range. But, the BMS in a large battery pack doesn't necessarily include a high power switch to allow it to shut down the battery.

Is a battery pack with a BMS better than a bare battery?

Sure, a battery pack with a BMS (Battery Management System) is better than a bare battery pack: it lets you know how the pack is doing, and it balances it. In a small battery (think "laptop battery") a BMS will also protect the cells by shutting down the current if the cells start getting too close to the edge of

their safe operation range.

What is a BMS and how does it work?

The BMS must be able to communicate with other components, to limit the current they source or draw, or even interrupt it. In particular, the BMS must be able to: Block diagram of standard EV system. The BMS controls the motor driver and the charger, to protect the battery.
