Bidirectional inverter gridconnected inverter

Overview

What is a bidirectional grid connected converter (BGC)?

The Bidirectional Grid Connected converter (BGC) is a key interface connecting the power grid and DC microgrid systems, which can realize bidirectional energy flow. The most common control method for grid-connected inverters is voltage and current double closed-loop control based on a proportional-integral (PI) regulator.

How do you control a grid connected inverter?

The most common control method for grid-connected inverters is voltage and current double closed-loop control based on a proportional-integral (PI) regulator. This control method can control the stability of the bus voltage on the DC side and ensure bi-directional power flow.

What is a bidirecion DC-AC inverter?

The bidirecion DC-AC inverter transfers power from the DC stage to the connected AC grid while the DC loading requirement is small. Or, the inverter transfers the power from the connected AC grid to the DC stage if the DC energy is insufficient for the DC loading requirement. In this document, basic knowledge of the inverter is presented first.

What are the problems with microgrid inverters?

However, for nonlinear and strongly coupled systems like microgrid inverters, with the passage of time, there are problems such as equipment performance degradation and disturbance of parameter perturbations, making it difficult to establish an accurate mathematical model.

How a solar inverter works?

The solution design includes bidirectional 3-phase DC-AC algorithms, and the maximum power point tracking (MPPT) DC-DC algorithm for solar panel control. The solar inverter has gained more and more attention in recent

years. The solar inverter gets the solar energy input, then it feeds the solar energy to the grid.

How does a DC-DC Solar inverter work?

This solution implements an isolated DC-DC stage with the MPPT algorithm, to make use of the full capacity of the solar panel. The solar inverter maintains its input voltage at the reference set point generated by the MPPT algorithm, and delivers power to a downstream DC-AC inverter when connected across its output.
