# Bifacial vs Single-Sided Photovoltaic Modules

#### **Overview**

What is the difference between Mono-facial and bifacial solar panels?

A system of one-sided solar panels known as a mono-facial solar panel system is set up in racks parallel to a surface, like a rooftop. Bifacial solar panels are positioned on a tilt instead of single-sided ones because they generate more energy when tilted off the roof or the ground at different angles.

Can bifacial solar panels increase photovoltaic energy production?

Bifacial solar panels have emerged as an alternative that can increase photovoltaic energy production by up to 30% of additional power thanks to the fact that both sides of the panel are able to absorb the sun's energy.

What is a bifacial solar panel?

Unlike monofacial panels, which only capture radiation from one side while the other side is made of an opaque material, bifacial panels are a type of solar panel that is characterised by an additional gain of radiation on both the front and back side of the panel, the value of which depends on a number of external factors.

How do monofacial solar panels work?

Monofacial solar panels function just like normal solar panels. They convert solar sunlight from the front surface of the panel into direct current, which is turned into AC with an inverter and then can be used to power our building and home. How Do Bifacial Solar Panels Work?

.

Can bifacial solar panels be installed on a single-axis solar tracker?

Besides, bifacial solar panels are not suitable to install on a single-axis solar tracking system with a single-row array because the rotation axis of this kind of solar tracker will obscure the back side of the bifacial solar panels.

What are bifacial photovoltaic (PV) modules?

In principle, bifacial photovoltaic (PV) modules are simply PV modules whose full rear contact has been replaced with a fingerprint contact. This means that also the rear of the panel can be exposed to solar radiation and be used to produce power.
