# Communication base station super capacitor rru silver wire

#### **Overview**

#### What are RRU and BBU in FTTA?

RRU (Radio Remote Unit) and BBU (Building Baseband Unit) are indispensable components in base station construction and FTTA. In a distributed base station architecture, the traditional macro station equipment have two distinct units based on their functions: the BBU and the RRU.

What are RRU & BBU?

RRU and BBU are crucial components in base station construction, enabling a distributed architecture that improves efficiency and reliability. RRU (Radio Remote Unit) and BBU (Building Baseband Unit) are indispensable components in base station construction and FTTA.

What is a remote radio unit (RRU)?

The main functions of the Remote Radio Unit (RRU) include: Communicating with the baseband pool (BBU) through optical fiber, including I/Q data and operation and maintenance messages. Connecting to the antenna array via RF cables to perform RF signal transmission and reception.

How does RRU connect to BBU?

Via optical fiber The RRU connects to the BBU, forming a new "distributed At the base of the tower locates BBU while the RRU is at the top of the tower. The RRU is further connected to the antennas via coaxial cables and power dividers (couplers), with the main trunk using optical fiber and the branch lines using coaxial cables.

How to reduce the transmit power of a RRU?

By placing the RRU at the top of the tower, close to the antennas. The RF cable connecting them becomes very short, referred to as a jumper. This connection almost neglect the signal attenuation. Consequently, the transmit power of the RRU can be appropriately reduced.

How is RRU connected to a base station?

The RRU is connected to the base station via the fiber optic link which is bidirectional link. The optical interface link is also known as CPRI (Common Public Radio Interface). CPRI is a interface protocol developed by combination of major telecom equipment's manufacturing company.
