Container frequency base station distance

Overview

How do I organize AXC containers into the IQ data block?

CPRI defines three mapping methods for organizing AxC containers into the IQ data block: (1) IQ sample based, (2) WiMAX symbol based, and (3) backward compatible. Mapping is further complicated with the need to support multiple wireless protocols, as well as multiple vendor-specific configurations and data.

How have base station architectures changed over time?

To keep up with these advancements, base station architectures have steadily evolved over time. The introduction of fourth generation cellular (4G) required major changes in the traditional analog radio architecture, such as the migration of all analog circuitry to the remote radio unit (RRU).

How many MHz is a UHF tag?

The UHF band is from 865 to 868 MHz in EU, versus 902 to 928 MHz in the US. Most UHF tags can operate simultaneously in both. By nature, RFIDs "adapt" their operating frequency to that of their local environment.).

How does CPRI organize AXC containers into IQ data block?

CPRI defines three mapping methods for organizing AxC containers into the IQ data block: IQ sample based, WiMAX symbol based, and backward compatible. Ethernet. The second data flow type defined in CPRI is the User Plane. The analog data is sampled and digitized into I and Q components.

What is the size of an AXC container?

The size of an AxC container is determined by the sample rate and sample size (anywhere from 8 to 20 bits for downlink and 4 to 40 bits for uplink). For example, if the sample size is set at 15 bits, then the AxC consists of 15 bits of I-data and 15 bits of O-data for a total of 30 bits.

Container frequency base station distance

Base stations

Base stations emit radiofrequency electromagnetic fields (RF EMF) in the range from several hundred MHz to several GHz. The exact frequency bands used differ between technologies ...
