

## SolarInvert Energy Solutions

# Does cluster communication require a base station

## Overview

---

What is clustering based communication mode?

The clustering-based communication mode is considered as the most suitable communication mode for the wireless sensor networks. Clustering consists in selecting a set of cluster-heads from the set of sensor nodes and then regrouping the remaining sensor nodes around the cluster-heads.

What is a clustering protocol?

Clustering protocols specify the topology of the hierarchical nonoverlapping clusters of sensor nodes. A robust clustering technique is essential for self-organizing sensor networks. An efficient clustering protocol ensures the creation of clusters with almost the same radius and cluster heads that are best positioned in the clusters.

What is efficient clustering protocol?

An efficient clustering protocol ensures the creation of clusters with almost the same radius and cluster heads that are best positioned in the clusters. Since every node in a clustered network is connected to a cluster head, route discovery among cluster heads is sufficient to establish.

How does clustering work?

Clustering consists in selecting a set of cluster-heads from the set of sensor nodes and then regrouping the remaining sensor nodes around the cluster-heads. The cluster-members send the data to the cluster-head that sends it back to the base station.

What is a cluster based network?

The aim is to work efficiently like an infrastructure-based network and be appropriately managed by making topology less dynamic. In the cluster, a node responsible for Intra- and inter-cluster communication is known as cluster head, whereas the other nodes that share their data to cluster head for

communication are called cluster members.

How do cluster-heads reduce the amount of data sent to the base station?

To reduce the amount of data to be transmitted to the base station, the cluster-heads aggregate the data received from the sensor nodes. In LEACH, the data is sent directly to the base station while in our protocol, it is sent from cluster-head to cluster-head until the base station.
