## Overview

---

DSP Flexipower UPSs offer superior technology and comfortable use with true sine wave output double conversion technology and high power factor PFC (<0.99). What is an uninterruptible power supply?

An uninterruptible power supply or uninterruptible power source (UPS) is an electrical apparatus that provides emergency power to a load when the input power source or mains power fails.

What is a dynamic uninterruptible power supply (Dups)?

Most UPS below one kilo volt-ampere (1 kVA) are of the line-interactive or standby variety which are usually less expensive. For large power units, dynamic uninterruptible power supplies (DUPS) are sometimes used. A synchronous motor/alternator is connected on the mains via a choke. Energy is stored in a flywheel.

What is a DSP flexipower ups?

DSP Flexipower UPSs offer superior technology and comfortable use with true sine wave output double conversion technology and high power factor PFC (<0.99).

What is a digital ups?

Although the UPS has traditionally been designed as analog circuitry, digital UPSs are now preferred. These devices use low-cost MCUs or DSPs and offer sophisticated control algorithms with highly flexible software, the ability to add user interfaces, reduce components, introduce testing procedures, and increase reliability.

What is AC ups output voltage?

The AC UPS output voltage is approximately equal to the AC UPS input voltage: The power devices and the output filter create a voltage drop of several volts, which is within the AC voltage tolerance. If a more precise

output voltage is required, a voltage transformer can be added to the UPS output.

What are the advantages and disadvantages of DSP-controlled active power factor correction (PFC)?

The advantage is a simple but reliable design. The drawback is a nonsinusoidal input current with high harmonic content and electromagnetic interference (EMI) that becomes more apparent in high-power systems. If sinusoidal input current is required, implement a DSP-controlled active power factor correction (PFC) circuit.
