Emergency communication high altitude base station

Overview

How drones can be used to build high-altitude base stations?

With recent advancements in drone technology, construct the high-altitude base stations by utilizing drones to carry the communication load for cellular networks has attracted con- siderable attention.

What is a drone base station?

As a rapid solution to provide wire- less connectivity, drone mounted base stations (drone-BSs) can assist cellular networks in cases of emergency comm- unication, public safety communication and post-disaster rehabilitation

Do drone base stations provide cellular networks in disaster areas?

Abstract: Drone base stations can provide cellular networks in areas that have lost coverage due to disasters. To serve the maximum number of users in the disaster area without apriori user distribution information, we proposed a 'sweep and search' algorithm to find the optimal deployment of drone base stations.

What if a BS is not covered by a base station?

In the disaster area, MSs have not been covered by any operational base station will conti- nuously perform an IMSI attaching procedure: scan the broadcast signal from cellular BSs, establish connections with the BS immediately after they received the broadcast signal.

Emergency communication high altitude base station
