# Fire protection in the energy storage cabin of the Tunisian photovoltaic power station

#### **Overview**

Are photovoltaic systems a threat to fire smoke protection?

To make buildings more energy efficient, advanced clean and energy efficient technologies, especially photovoltaic (PV) systems, have become widely applied in new and existing buildings and communities, which, meanwhile, brings a new and intractable challenge to fire smoke protection.

Are green building and energy efficient technologies causing fire safety problems?

This is why green building and energy efficient technologies, especially photovoltaic (PV) systems, have been widely applied in new and existing constructions. They can, however, cause a new intractable challenge, i.e., fire safety.

Do photovoltaic systems improve fire safety?

Studies on photovoltaic modules have mainly focused on improving productivity and performance, while no study has viewed the impact of the use of BAPV and BIPV systems on the overall fire safety of a building. There is not enough literature regarding fire scenarios addressing various types of PV systems, which can be installed on buildings.

How arc fault is causing fire in a PV power plant?

Last but not least, a persistent DC electrical arc is one of the major causes of fire ignition in a PV power plant (Cancelliere, 2014). There are many studies on the arc fault protection strategies such as the study conducted by Xia et al. (2016) on the arc fault detection for household photovoltaic systems.

Is there a fire report system for PV panels?

To begin with, our analysis shows that currently, there is no appropriate system for reporting and recording fire incidents involving or initiated by a PV panel system. Therefore, there is not enough documented information

regarding the causes and extent of PV fire damage.

Are PV fire suppression and firefighting toxicity related?

PV fire suppression, firefighting and the toxicity of fire residues are not studied or identified for future research needs. Moreover, no study has been conducted on the smoke flow distribution entering the indoor spaces. Smoke transfer is possible via the shafts and roof ducts or by the breakage of the BIPVs.
