Flywheel energy storage system in wind farm

Overview

Flywheel energy storage systems (FESSs) are widely used for power regulation in wind farms as they can balance the wind farms' output power and improve the wind power grid connection rate. How a flywheel energy storage system can improve wind power quality?

The flywheel energy storage system can improve the quality of the grid by smoothing the high-frequency wind power output of wind power. The use of the MPC control system can realize the smoothing of wind power fluctuations on a short time scale. MPC combined with flywheel energy storage system can improve the power quality of wind power output.

What is flywheel energy storage?

Since flywheel energy storage is used for power smoothing in wind power systems, the charging and discharging of flywheel energy storage and the fluctuating state of wind power are shown in the two-dimensional plane.

What is flywheel energy storage system (fess)?

Abstract. Flywheel energy storage system (FESS) will be needed at different locations in the wind farm, which can suppress the wind power fluctuation and add value to wind energy. A FESS that can store up to 3.6 kWh of usable energy in 12 minutes at a maximum 24,000 r/m was designed.

How fast is a flywheel energy storage device for a 30 MW wind farm?

The high-frequency component of the wind power output power data accounts for less than 10 % of the total energy. Therefore, this study selects a 100 MJ/0.3 MW flywheel energy storage device for a 30 MW wind farm, and the rated speed of the flywheel is 4000 r/min. 2.2. Energy storage systems.

Can flywheel energy storage be controlled?

The development of flywheel energy storage has garnered the attention of several researchers for studying the control method of FESS; As shown in

literature , an online energy management algorithm is proposed on the basis of GAMS, but there is no research on frequency division of wind power.

How does a flywheel work?

The flywheel in literature stores energy about 4.5 MJ, which can reduce the impact of fluctuations of wind energy effectively and compensate reactive power . It supplies power to the whole system for 1.8 minutes, which gives the standby diesel engine sufficient time for the restart.
