

SolarInvert Energy Solutions

Grid-connected inverters that can be exported

Overview

Can solar energy be exported to the grid?

In many jurisdictions, regulations mandate limitations on the export of solar energy to the grid. Zero export devices ensure compliance with these regulations, avoiding potential penalties or restrictions imposed on solar installations that exceed export limits.

Can a grid connected inverter be left unattended?

Do not leave the design powered when unattended. Grid connected inverters (GCI) are commonly used in applications such as photovoltaic inverters to generate a regulated AC current to feed into the grid. The control design of this type of inverter may be challenging as several algorithms are required to run the inverter.

What is the control design of a grid connected inverter?

The control design of this type of inverter may be challenging as several algorithms are required to run the inverter. This reference design uses the C2000 microcontroller (MCU) family of devices to implement control of a grid connected inverter with output current control.

What should a user not do when using a grid connected inverter?

The user must not touch the board at any point during operation or immediately after operating, as high temperatures may be present. Do not leave the design powered when unattended. Grid connected inverters (GCI) are commonly used in applications such as photovoltaic inverters to generate a regulated AC current to feed into the grid.

Are zero-export devices a solution to solar power grid integration?

But there are obstacles in the way of solar power grid integration, especially when it comes to surplus energy production. In order to maximize the benefits of solar energy systems while reducing their influence on the grid, the idea of

zero-export devices presents itself as a solution to this conundrum.

How do I know if a grid connected inverter is working?

Observe the current that is shared on the load by the inverter, and the AC source. Spiking around the zero crossing can occur. These spikes may be mitigated by the user by selecting a different inverter configuration, or using a different modulation scheme. The verification of the grid connected mode of operation is complete.
