

## SolarInvert Energy Solutions

# High frequency inverter rcd

## Overview

---

What type of RCD should I use for my inverter?

They therefore find applications in photovoltaic systems, electro-medical devices, three-phase frequency converters, AC / DC converters. three-phase or three-phase uninterruptible power supplies. In general, therefore, the type B RCD is recommended for each type of inverter.

Which type of RCD should be used for a single-phase inverter?

In general, therefore, the type B RCD is recommended for each type of inverter. Only type F can be used, instead of type B, for single-phase inverters only.

What is a residual current device (RCD / GFCI)?

If a residual current device (RCD / GFCI) or a residual current monitor (RCM) is used for protection against direct or indirect contact, the following specific types must be used: Use a Type A Residual Current Device (RCD / GFCI) or a Residual Current Monitor (RCM) for single-phase drives connected to a phase and to the neutral conductor.

Which RCDs are exposed to a residual current?

RCDs 1 to 5 were exposed in to a residual current with a frequency of 11.5 kHz up to 102 mA with no tripping attained; RCDs 6 to 13 were exposed to a residual current with a frequency of 2 kHz up to 380 mA with no tripping attained.

What is a frequency model for RCDS?

A frequency mapping of the RCDs is performed, and an assessment of these results based on the frequency-dependent response of the human body to currents is performed. Finally, a frequency model for RCDs type A, F and B is developed. residual current at which the RCD trips in the base case (pure 50 Hz), rms.

## What is a RCD Type?

The type defines the characteristics of the residual current for which tripping of the RCD is ensured, and to which the RCD is ensured to be immune. There are different types available in the market. Type AC and A RCDs are specified for operation at 50/60 Hz.
