

## SolarInvert Energy Solutions

# How big of a circuit breaker should a battery cabinet be equipped with

## Overview

---

A Circuit breaker (CB) is a control and protection device which: 1. Control (make or break) a circuit manually or by remote control under normal and fault conditions. 2. Break a circuit automatically under.

The following circuit breaker sizing calculator will show the difference in % to the load, voltage level in different countries and exact size of breaker in amperes. Related Calculators: 1. Electrical Cable &.

To determine the appropriate size of circuit breaker for single phase supply, it depends on multiple factors like type of load, cable material and ambient temperature etc. According to NEC 210.19(A), 210.20(A), 215.2, and 230.42(A), the general rule of thumb is that the circuit breaker size should be rated at 125% of the ampacity of the cable and w.

To determine the breaker size for a three-phase supply, it's important to know the exact type of load, as various factors influence the load current. In other words, the same rule won't apply to different types of loads, such as lighting, motors, or inductive/capacitive loads. For example, motors draw significantly higher current during startup and.

Example 1: What is the suitable size of circuit breaker for 230V, 2.85kW load single phase circuit?

Solution: 1. Current = Power / Voltage 2.  $I = 2,850 \text{ W} / 230\text{V}$  3.  $I = 12.40 \text{ A}$   
The minimum and recommended size of circuit breaker:  $= 10.21\text{A} \times 1.25 = 15.5 \text{ A}$   
Next Standard Size Breaker = 16 A The next standard size available is 16A to use with.

Generally, you should size a breaker for 125% of the load (or 25% extra capacity) and no less. Oversized breakers can allow wires to heat above safety levels without stopping the current. What size breaker should I use for a battery cabinet?

Round the breakers up to next common size and you have 600A vs 500A. If the battery cabinet design is only for capacity (meaning all cabinets must be on line to handle discharge) one could use 500A breaker, maybe even 450A in the scenario above. Sometimes it is requested that 600A be used however.

What size circuit breaker do I Need?

The general rule of thumb is that circuit breaker size should be rated 125% of the ampacity of circuit requirements. For the calculation example, use the 6000XP nameplate sticker listed above. The max AC input is rated at 45A. To properly size the required breaker, take  $45A \times 1.25$  (125%) which equals 56.25A.

What is the sizing current of a battery circuit breaker?

The battery circuit breaker sizing current =  $1.25 \times \text{charging current} = 1.25 \times 400A = 500A$ . The standard rating of DC circuit breaker is 500A. The battery short-circuit current, per published data for the battery = 9,050A Therefore, the recommended circuit breaker in this example=500A, 65VDC, 10,000 AIC.

What is a good voltage breaker for a battery?

The standard rating of a DC circuit breaker is 700A. The battery short-circuit current, per published data for the battery=14,750A. Therefore, the recommended circuit breaker in this example=700A, 65VDC, 15,000 AIC. Moving onto the conductor, we know the cable sizing current= $1.25 \times 533 = 666A$ .

What is a DC rated battery circuit breaker (BCB)?

These can be equipped with a monitoring device connected to the UPS or BMS to warn if a fuse has tripped or is disconnecting the battery from the UPS. The DC rated Battery Circuit Breaker (BCB) provides still overcurrent protection, if correctly coordinated, even though it is not as fast as the fuses.

What size circuit breaker should be used for a 16 amp circuit?

Suppose a 12-gauge wire is to be used for a 16-ampere lighting circuit with a 120V single-phase supply. What is the appropriate size of a circuit breaker for this 16-amp circuit?

Solution: Circuit Current: 16 A Circuit Breaker Size: ?

CB size should be rated at 125% of the circuit current. =  $125\% \times 16 A = 1.25 \times 16 A$
