# How long can the base station wind power supply last

2MW / 5MWh Customizable

### **Overview**

How long do wind turbines last?

On average, the expected service life of a wind turbine is approximately 25 years, but this doesn't mean that each component is meant to last for 25 years. There are several ways to extend the lifespan of wind turbines. High-quality materials and an aerodynamic design are important for maximising the energy capacity of turbines.

How can the lifecycle of a wind turbine be extended?

The lifecycle of a turbine can be extended through careful monitoring and maintenance. This requires the condition of the asset to be assessed and compared with the expended lifespan of the turbine, based upon the expected loads and fatigue as well as environmental factors for the wind energy site.

How often do wind turbines need to be replaced?

While wind turbine technology is constantly improving, even the most sturdy wind turbines still require annual maintenance and do wear out. For example, gearboxes generally need to be rebuilt every eight to 10 years. Consequently, a turbine's economic life is finite. In addition, Investors often fail to budget for removal costs.

What factors determine a wind turbine's life?

What Factors Determine a Wind Turbine's Life?

Modern wind turbines are designed to last 20 years and with proper monitoring and preventative maintenance two to three times per year (increasing with frequency as the turbine ages) their lifetime can be extended to 25 years.

Do wind turbines need maintenance?

Periodic maintenance schedules, including routine checks on the blades,

gearbox, and generator, are essential for extending the turbines' lifespan. Corrective maintenance involves addressing any issues or failures that occur during the lifespan of wind turbines.

Do wind turbine blades end up in landfill?

Made of fibreglass, wind turbine blades usually end up in landfill. Credit: Andreas Nesslinger / Shutterstock Across the world, ageing wind turbines are nearing the end of their lifespan, which begs the question of what happens to their components after they are decommissioned. Wind turbines have a lifespan of between 20 and 30 years.
