How many uninterruptible power supplies should I buy

Overview

What is an uninterruptible power supply (UPS)?

An uninterruptible power supply (UPS), offers guaranteed power protection for connected electronics. When power is interrupted, or fluctuates outside safe levels, a UPS will instantly provide clean battery backup power and surge protection for plugged-in, sensitive equipment.

What are the different types of uninterruptible power supply systems?

There are various types of uninterruptible power supply (UPS) systems available to provide protection from power problems. Understanding the differences allows you to choose the right UPS for your specific needs. A standby UPS is the most affordable and common type for home and small business use.

Do you need an uninterruptible power supply?

To protect your likely expensive investment, an uninterruptible power supply is integral. This applies especially to areas that suffer from frequent power outages, particularly rural areas, extreme climates, or places with bad power grids. In order to buy the right UPS, however, you'll need to make sure that some basic requirements are met.

How much power does an ups need?

When sizing a UPS for your specific requirements, the power factor matters most. Generally, your UPS should have an Output Watt Capacity 20-25% higher than the total power drawn by any attached equipment. How much runtime do you need to support your attached equipment?

That depends on what you intend to backup with your UPS.

What is the power factor of an ups?

The ratio of watts to VA is called the 'power factor' and is expressed either as

a number (i.e. - 0.8) or a percentage (i.e. - 80%). When sizing a UPS for your specific requirements, the power factor matters most. Generally, your UPS should have an Output Watt Capacity 20-25% higher than the total power drawn by any attached equipment.

What happens if a ups runs out of power?

When a UPS runs out of power, a technician typically has to go to the rack and manually reboot the UPS once primary power is restored. A UPS with an auto-restart feature does this automatically, reducing labor costs.
