# How much voltage is used to charge a 7 4v lithium battery pack

#### **Overview**

What is the voltage range of a 7 4 volt lithium battery?

The voltage range of a 7.4 V lithium battery is generally as follows: Nominal voltage: 7.4V. This is the voltage output by the battery under ideal conditions, usually marked on the battery. Full voltage: about 8.4V. When the battery is fully charged, the voltage will reach its highest value, generally around 8.4V. Low voltage: about 6V.

What is a 7 4 volt battery?

Part 1. What is a 7.4 V battery?

A 7.4V battery is a rechargeable lithium-based power source, typically configured as a 2-cell (2S) lithium polymer (LiPo) or lithium-ion (Li-ion) pack, with each cell providing a nominal voltage of 3.7V, totaling 7.4V when combined in series.

What is a 7.4v Li-ion battery?

A 7.4V Li-ion battery is also a rechargeable battery that uses lithium-ion chemistry. Li-ion batteries are similar to LiPo in voltage and capacity but have a more rigid, cylindrical shape. The 7.4V nominal voltage is typically achieved by connecting two 3.7V Li-ion cells in series.

How many volts does a lithium ion battery charge?

Lithium-ion batteries typically charge to 4.20V per cell, with a tolerance of ±50mV. Nickel-based varieties usually charge to 4.10V per cell. For high-capacity lithium-ion batteries, the charging voltage may reach 4.30V or more, depending on their specific chemistry. Charging at levels below 3.0 volts can lead to battery damage and capacity loss.

What is a 7 4 volt lipo battery?

A 7.4V LiPo battery, also known as a 2S LiPo battery or a 7.4V LiPo battery

pack, is a type of lithium polymer battery. The "7.4V" part of the name refers to the voltage, which is a combination of the individual cells inside the battery. Each cell in a LiPo battery typically has a nominal voltage of 3.7V.

How many volts does a battery need?

When fully charged, the voltage reaches 8.4V (4.2V per cell), while discharging below 6.0V (3.0V per cell) can damage the battery.
