# How to calculate the energy storage specifications of charging stations

#### **Overview**

How much energy does an EV use per station per year?

The total EV charging energy is 22.3 MWh per station per year. The results show that as the PL and the charging plaza size increase, the relative ESS power and energy requirements and the utilization rate of the ESS decrease. This decrease is faster with low PLs and small plaza sizes and slows down with the increasing PL and charging plaza size.

How can energy storage systems prevent EV charging problems?

These problems can be prevented by energy storage systems (ESS). Levelling the power demand of an EV charging plaza by an ESS decreases the required connection power of the plaza and smooths variations in the power it draws from the grid.

What is required ESS Energy capacity?

Required ESS energy capacity with respect to the nominal rated charging power for 4, 12, 20, and 40 DCFC stations as a function of the power limit. The share of total EV charging energy cycled through the ESS is presented in Fig. 8 for various charging plaza sizes as a function of the PL.

How much energy is required for a charging Plaza?

For a charging plaza with 4 DCFC stations, an energy capacity of 0.58 h with respect to the nominal charging power is required to limit PL of the charging plaza at 20% of the nominal charging power while the requirement was 0.12 h for the plaza with 40 DCFC stations.

How much electricity does a charging station save?

The research results indicate that during peak hours at the charging station, the probability of electricity consumption exceeding the storage battery's capacity is only 3.562 %. After five years of operation, the charging station has saved 5.6610 % on electricity costs.

How is energy storage battery cost determined?

In terms of variable costs, the capacity and electricity cost of the energy storage battery (ESB) is determined based on the power needed during peak hours, and the electricity cost during non-peak hours is obtained using the arrival rate of electric vehicles during non-peak hours.
