### How to check wind power in Estonian communication base stations

#### **Overview**

How to identify wind turbine echoes?

Once the wind farm is installed, only the identification of the echoes from wind farms within the radar results and mitigation measures in the radar segment can be applied. The radar signatures of wind turbines can be identified on the radar display, as they have specific properties which allow the proper differentiation from desired targets.

Are radiolinks obstructed by wind turbines?

It is clearly observed that the radiolinks depicted in green are not obstructed by the wind turbines, while the turbines intercept the second Fresnel zone of the radiolink depicted in red. Fig. 13. Example of the exclusion volumes that should be respected to avoid diffraction effects on radiolinks .

Which telecommunication services are more sensitive to wind turbines?

The telecommunication services included in this review are those that have demonstrated to be more sensitive to nearby wind turbines: weather, air traffic control and marine radars, radio navigation systems, terrestrial television and fixed radio links.

How can a wind turbine not disturb a radio link?

The proper location for the turbine to not disturb the radio link can be assessed by applying the bistatic radar equation in suitably small increments of the distance of the wind turbine to the radio path until the required value of C/I ratio is obtained . 5.3. Mitigation measures.

Why is wind power a problem in telecommunications?

Wind power is one of the fastest-growing technologies for renewable energy generation. Unfortunately, in the recent years some cases of degradation on certain telecommunication systems have arisen due to the presence of wind farms, and expensive and technically complex corrective measurements have

been needed.

How are wind turbine echoes characterized in weather radars?

For example, in weather radars, although echoes from isolated storms are mixed with the wind turbine clutter echoes, the wind turbine signals are characterized by random radial velocity and large spectrum width, as it can be observed in Fig. 10.
