Land for new energy storage projects

Overview

Why should you lease a site for a battery energy storage system?

Land is the most important resource for the development of battery energy storage systems. Several factors must be considered when considering the leasing of a site for a BESS project, some of the most important being: The size of the land required for a BESS project depends on the capacity of the battery system.

What is an energy storage project?

An energy storage project is a cluster of battery banks (or modules) that are connected to the electrical grid. These battery banks are roughly the same size as a shipping container. These are also called Battery Energy Storage Systems (BESS), or grid-scale/utility-scale energy storage or battery storage systems.

Should you lease or make money from your land for battery storage?

The evolving landscape of renewable energy and the increasing demand for reliable energy storage solutions have led to greater interest in battery storage projects across the United States. As a landowner, the prospect of leasing and making money from your land for battery storage might be an enticing opportunity.

Why are solar & battery storage lease rates increasing?

The increasing demand for land suitable for solar and battery storage projects has driven up lease rates in recent years, especially because of the incentives offered by the IRA Renewable Energy. As the industry expands, competition for land is intensifying, particularly in regions with favorable solar and wind resources.

How will energy storage technology change the future?

Technological Changes: Rapid advancements in energy storage technologies

may render current systems obsolete in the future. There are projections that future batteries will have improvements such as extended life cycles, faster charging and recharging, enhanced safety features, employing AI, Internet of Things (IoT), among others.

How much land do you need for a lithium-ion battery storage system?

According to Convergent, the land use requirements for utility-scale lithiumion battery storage system is about 0.02 acres per MWh of storage capacity, depending on factors such as the battery chemistry, the size of the system, and the location of the installation. This is small compared to the 4 – 7 acres per MW that are required for solar PV.
