# Mobile base station turns off a power supply

#### **Overview**

How do mobile base stations work?

Mobile base stations are normally hooked up to the power grid, using that electricity to amplify the cell signal to the broader area. During a power outage, an on-site battery kicks in to keep the tower running. If the outage persists, a crew could arrive with a diesel generator to keep powering the tower.

What are the primary sources of power for a mobile base-station?

The primary sources of power for these mobile base-station vary by region and can generally be categorized into 3 buckets: Reliable grid power: AC mains or grid power can reliably serve as the primary power supply.

What is the main source of power for a base station?

In the case of base stations situated in regions with bad-grid or off-grid power availability, the predominant source of power for the base stations is diesel generators. [4,6] Diesel generation is costly in both the procurement of fuel and travel required to maintain adequate fuel levels at the base stations.

How much energy does a cellular base-station consume?

Less well known is that about 0.5% of the global energy supply is consumed by mobile communications infrastructure, alone, [6,7] Among the mobile communications infrastructure, cellular base-stations have the largest appetite, consuming around 80% of total power, in studies completed of 2G and 3G networks, and of 3G and 4G networks. [6,8]

#### Mobile base station turns off a power supply

### A Device that Controls the Power Supply Sources of a Mobile

Abstract In this research work, the classifications of the device that controls the energy supply sources of the mobile communication base station are presented. The device is used to ...
