New battery cabinet layout in the computer room

Overview

What should a battery room layout look like?

Battery room layouts should be clean and designed to maximize space usage. Proper code clearances must be maintained in and around battery strings for required maintenance support and life safety systems. Egress aisles, exit ways, and maintenance aisles also must be maintained.

How should battery racks and cabinets be designed & installed?

Battery racks and cabinets should be designed and installed to meet the requirements for the seismic zone they are installed in. The racks and cabinets should be designed and purchased to accommodate the weight and size of the batteries ordered and the quantity of batteries to be installed. (See attached picture.).

How should a battery room be positioned?

The positioning of the battery room must be in close proximity to the UPS modules being supported. For voltage drop considerations, the UPS modules and battery systems should be in adjacent spaces— either side-by-side or vertically stacked. Battery room layouts should be clean and designed to maximize space usage.

How should a battery room be designed?

Battery rooms should be designed with an adequate exhaust system, which provides for continuous ventilation of the battery room to prohibit the build up of potentially explosive hydrogen gas. During normal operations, off gassing of the batteries is relatively small.

Can a battery be installed in a computer room?

Sometimes they are installed in the same room as the UPS (i.e., electrical equipment room). Local or regional codes may dictate whether batteries are permitted in an electrical room. Smaller UPS systems (e.g., up to 250 kVA) are

commonly installed directly in the computer room along with their respective battery cabinets.

How do I set up an UPS battery room?

Open-rack battery rooms must be adjacent to the UPS room. Battery cabinets must be adjacent to the UPS equipment. Cable lengths from multiple cabinets should be kept as nearly identical as possible to prevent voltage drop variations. One cabinet should be able to hold at least one complete string of cells.
