# Outdoor power supply can be interconnected

#### **Overview**

What is an outdoor Uninterruptible Power Supply?

An outdoor Uninterruptible Power Supply is a power solution designed for critical applications where it's essential that equipment stays running in harsh outdoor environments and significant temperature variations, where an ordinary UPS would fail. Trust TSi Power for these applications.

Why do power stations need to be interconnected?

When large loads are to be supplied from two power stations, the power stations are required to be interconnected so that there is no overloading and the loads are shared almost equally. Consider two power stations S 1 and S 2 supplying load currents I 1 and I 2 to the load through transmission lines 1 and 2 in addition to their local loads.

What are interconnectors in parallel?

Interconnectors in Parallel. Introduction to Interconnectors: When large loads are to be supplied from two power stations, the power stations are required to be interconnected so that there is no overloading and the loads are shared almost equally.

Why do interconnectors have impedance?

The incorporation of interconnector introduces angular displacement between the two stations, enabling the power to flow from one station to the other as required by operating conditions. The incorporation of impedance will cause an unnecessary loss of power. Load Sharing of Interconnectors:.

Why do power stations need two interconnectors in parallel?

Interconnectors in Parallel: It becomes sometimes necessary to connect two power stations S 1 and S 2 through two interconnectors in parallel running along the same or different routes. This situation arises when the power under transfer exceeds the capacity of a single interconnector.

What happens if the power under transfer exceeds a single interconnector?

This situation arises when the power under transfer exceeds the capacity of a single interconnector. The load shared by two interconnectors will be in the inverse ratio of their impedances Z 1 and Z 2 as the voltages at the sending end and receiving end of the both the interconnectors are the same.
