# PACK battery selection

## Overview

---

What are battery packs?

Battery packs are constructed from two or more individual cells or batteries. They come in two basic types: primary and secondary or rechargeable. Primary batteries are disposable, non-rechargeable devices that must be replaced once their energy supply is depleted.

What are the two basic types of battery packs?

There are two basic types of battery packs: primary and secondary or rechargeable. Primary batteries are disposable, non-rechargeable devices. They must be replaced once their energy supply is depleted. Battery packs are constructed from two or more individual cells or batteries.

What are the parts of a battery pack?

A battery pack consists of several interconnected parts, each playing a vital role in energy storage and power delivery: Battery Cells – The core energy storage units. Battery Management System (BMS) – Regulates voltage, temperature, and safety. Cooling System – Prevents overheating and maintains efficiency.

How do you design a battery pack?

Designing an efficient and reliable battery pack involves multiple engineering considerations. The following key factors influence performance, safety, and durability. Voltage (V): Total voltage increases when cells are connected in series. Capacity (Ah): Total capacity increases when cells are connected in parallel.

How do I choose the right battery pack for my EV?

Choosing the right battery pack depends on application needs, energy density, weight, and cooling systems. For EVs, high-capacity lithium-ion packs offer efficiency and longevity. A well-designed battery pack improves safety,

durability, and efficiency.

What makes a good battery pack?

Designing a reliable, safe and efficient battery pack isn't just about selecting the right cells or managing heat, it's about integrating every subsystem into a cohesive, validated system.
