

## SolarInvert Energy Solutions

# Photovoltaic glass characteristics

## Overview

---

### What is Solar Photovoltaic Glass?

This article explores the classification and applications of solar photovoltaic glass. Photovoltaic glass substrates used in solar cells typically include ultra-thin glass, surface-coated glass, and low-iron (extra-clear) glass.

### What are the characteristics of glass for solar applications?

For solar applications the main attributes of glass are transmission, mechanical strength and specific weight. Transmission factors measure the ratio of energy of the transmitted to the incoming light for a specific glass and glass width. Ratio of the total energy from an AM1-5 source over whole solar spectrum from 300 - 2,500nm wavelength.

### Why is Solar Photovoltaic Glass so popular?

With global attention on environmental protection and energy efficiency steadily rising, the demand for solar photovoltaic glass in both commercial and residential construction sectors has significantly increased. The desire to reduce energy costs and carbon footprint has driven the widespread adoption of solar photovoltaic glass.

### What are the different types of Photovoltaic Glass?

These three products have entirely different characteristics and functions, leading to significant differences in their added value. Currently, the most widely used photovoltaic glass is high-transparency glass, known as low-iron glass or extra-clear glass. Iron in ordinary glass, excluding heat-absorbing glass, is considered an impurity.

### Can glass be used for solar energy?

The initial development and utilization of solar cells using glass, soon gained attention from countries like the United States and Japan, thereby accelerating the research, development, and application of low-iron, ultra-thin glass for

solar energy purposes. Demand for solar photovoltaic glass has surged due to growing interest in green energy.

Why is glass used in photovoltaic modules?

Glass is used in photovoltaic modules as layer of protection against the elements. In thin-film technology, glass also serves as the substrate upon which the photovoltaic material and other chemicals (such as TCO) are deposited. Glass is also the basis for mirrors used to concentrate sunlight, although new technologies avoiding glass are emerging.
