Photovoltaic glass processing steps

Overview

What is the production process of Photovoltaic Glass?

Production process of photovoltaic glass The deep processing process of photovoltaic glass involves two steps: tempering and coating. The original sheet is ground and then tempered to obtain tempered sheets, or tempered and coated to obtain coated sheets for component packaging.

What raw materials are used in Photovoltaic Glass production?

The raw materials used in the production of photovoltaic glass raw materials include soda ash, quartz sand, feldspar, dolomite, limestone, mirabilite, etc. Quartz sand and soda ash are not only the main components in material input, but also the two types of raw materials that have a significant impact on material costs.

How are photovoltaic absorbers made?

The manufacturing typically starts with float glass coated with a transparent conductive layer, onto which the photovoltaic absorber material is deposited in a process called close-spaced sublimation. Laser scribing is used to pattern cell strips and to form an interconnect pathway between adjacent cells.

What is glass deep processing?

In order to control costs, glass deep processing often uses both glass tempering and film heat treatment simultaneously. In the production process of photovoltaic glass, the cellar furnace is the core production equipment and also a large investment equipment.

What is Photovoltaic Glass?

At present, the mainstream product of photovoltaic glass is low-iron tempered patterned glass (also known as tempered suede glass) with a thickness of 3.2mm or 4mm.

How do solar panels work?

After installing solar cells on the edge of the glass, a mixed coating is applied to the surface of the glass. The coating absorbs sunlight and transmits it to the solar cells installed on the edge of the glass at different wavelengths.
