Solar energy distribution system cost

Overview

The broadening of our energy system to include increasing amounts of wind and solar has led to significant debate about the total costs and benefits associated with different types of generators—with potential.

What are the costs associated with integrating PV into bulk power and distribution systems?

The costs associated with integrating PV into bulk power and distribution systems are both commonly referred to as “grid integration” costs; however, in general, modeling the cost of each of these systems involves distinct challenges.

How much does a distribution system upgrade cost per MW?

Distribution system upgrade costs per MW depend significantly on the feeder, loading, and PV placement. Costs ranged from $\sim \$0.23/\text{kW}$ to $\$118.7/\text{kW}$. Distribution system upgrade costs are not necessarily higher for feeders with higher PV penetration levels.

How much does a distributed generation system cost?

Furthermore, the optimal solutions from integrating distributed generation units such as WFs, PVFs, and BESS also bring great benefits compared to the non-integrated system. In the base system, total costs are very high and equal to \$44.5685 million. On the contrary, the total costs are significantly smaller in the modified system.

What is considered a cost of a power plant?

The considered costs include (1) investment, operation, and maintenance (O&M) costs of WFs, PVFs, and BESS; (2) imported energy cost for loads and power losses from the main power grid; and (3) generated emission cost from conventional power plants considering time-varying generation and consumption.

How much does PV installation cost?

Costs associated with distribution line upgrades and losses may be positive (PV deployment results in a net cost compared to their base case) or negative (PV deployment results in a net benefit compared to their base case).

Calculated costs of distribution lines with PV compared to the base case range from – 25 €/MWh to 9 €/MWh.

How many wind farms & photovoltaic farms can be integrated into a distribution system?

This work has assumed that two wind farms, two photovoltaic farms and one battery energy storage system are integrated into the distribution systems by applying inverters with a fixed 0.9 lagging power factor 31. Minimum and maximum numbers of the WFs and PVFs are 2 and 15 wind turbines, and 2,000 and 10,000 photovoltaic modules, respectively.
