#### **Overview**

Are flow batteries the future of energy storage?

Realizing decarbonization and sustainable energy supply by the integration of variable renewable energies has become an important direction for energy development. Flow batteries (FBs) are currently one of the most promising technologies for large-scale energy storage. This review aims to provide a comprehen ChemSocRev – Highlights from 2023.

Can a zinc iodine single flow battery be used for energy storage?

With super high energy density, long cycling life, and a simple structure, a ZISFB becomes a very promising candidate for large scale energy storage and even for power batteries. A zinc-iodine single flow battery (ZISFB) with super high energy density, efficiency and stability was designed and presented for the first time.

What are the different types of flow batteries?

Currently, the flow battery can be divided into traditional flow batteries such as vanadium flow batteries, zinc-based flow batteries, and iron-chromium flow batteries, and new flow battery systems such as organic-based flow batteries, which hold great promise for energy storage applications.

What is a zinc iodine flow battery (zifb)?

A zinc-iodine flow battery (ZIFB) with long cycle life, high energy, high power density, and self-healing behavior is prepared. The long cycle life was achieved by employing a low-cost porous polyolefin membrane and stable electrolytes. The pores in the membrane can be filled with a solution containing I 3— that can react with zinc dendrite.

Are zinc-based flow batteries good for distributed energy storage?

Among the above-mentioned flow batteries, the zinc-based flow batteries that leverage the plating-stripping process of the zinc redox couples in the anode

are very promising for distributed energy storage because of their attractive features of high safety, high energy density, and low cost .

What are zinc-bromine flow batteries?

Among the above-mentioned zinc-based flow batteries, the zinc-bromine flow batteries are one of the few batteries in which the anolyte and catholyte are completely consistent. This avoids the cross-contamination of the electrolyte and makes the regeneration of electrolytes simple.
