# Zinc-Silver Flow Battery

## Overview

---

Are aqueous zinc-based flow batteries a promising energy storage technology?

Aqueous zinc-based flow batteries (ZFBs) represent one of the most promising energy storage technologies benefiting from their high safety and competitive energy density. However, the morphological evolution of Zn still remains vague but is significant in the electrolyte, whose Zn  $^{2+}$  concentration constantly decreases during Zn plating.

What is a zinc-based hybrid flow battery?

Zinc-based hybrid flow batteries are one of the most promising systems for medium- to large-scale energy storage applications, with particular advantages in terms of cost, cell voltage and energy density. Several of these systems are amongst the few flow battery chemistries that have been scaled up and commercialized.

What are the advantages of zinc-based flow batteries?

Benefiting from the uniform zinc plating and materials optimization, the areal capacity of zinc-based flow batteries has been remarkably improved, e.g., 435 mAh cm  $^{-2}$  for a single alkaline zinc-iron flow battery, 240 mAh cm  $^{-2}$  for an alkaline zinc-iron flow battery cell stack, 240 mAh cm  $^{-2}$  for a single zinc-iodine flow battery.

Can a zinc-silver/air hybrid flow battery extend the cycling life?

This work demonstrates an improved cell design of a zinc-silver/air hybrid flow battery with a two-electrode configuration intended to extend the cycling lifetime with high specific capacities up to 66.7 mAh cm  $^{-2}$  at a technically relevant current density of 50 mA cm  $^{-2}$ .

Should zinc-cerium flow batteries be developed?

The early development of zinc-cerium flow battery has been reviewed by

Walsh et al. Future work on this system should focus on low-cost, chemically stable electrodes and electrolytes to dissolve more cerium species at low acid concentrations.

Do all zinc-based flow batteries have high energy density?

Indeed, not all zinc-based flow batteries have high energy density because of the limited solubility of redox couples in catholyte. In addition to the energy density, the low cost of zinc-based flow batteries and electrolyte cost in particular provides them a very competitive capital cost.
